In this article, the author will describe what has happened in the last decade with regard to the development of myocardial infarction [1,3].

First, she would like to say that we are not dealing with the same populations that existed about 15 or 20 years ago [4].

For about 12 years, we have been dealing with a different population because, after the modernization of the means of communication, there was a change at the energy level of the human being, a change that does not initially appear in tests and only becomes apparent after many years of deficiency if left untreated [5].

She is talking about the *New Global Immunodeficiency*, which she diagnosed in 2014 and which no other professional on this planet had yet been able to diagnose, because to understand the whole process involved, the doctor needs to receive training in the teachings of traditional Chinese medicine and other ancient medical traditions such as Ayurvedic medicine, which has existed for over 5,000 years [5].

According to Hippocrates (460 b.C.- 370 b.C), the father of medicine, he said that "we should use older medicines before current medical practice". He said this because our modern medicine is only 116 years old, if we count from the changes that occurred after the guidelines for medical education were changed, following the implementation of the Flexner Report in 1910 [6,7].

The execution of the Flexner Report at that time was important in the field of medical research, and great progress has been made since then. However, over the years, with the advancement of technology, especially in the communications segment, we have begun to observe some changes in the energy patterns of the world's population, and we continue to witness changes that did not exist before [4,7].

These changes in the internal energy pattern that she is talking about are changing the way doctors have to treat patients, because medications that were previously used to treat various pathologies are now causing many side effects without medicine understanding the reason for such a reaction [8,9].

Since all these changes occur at the energy level, modern Western medicine is unable to make this diagnosis, much less provide treatment, and continues to treat patients in the same way. This needs to change, as doctors should use medications with the fewest possible side effects, so that patients can entrust their lives to the doctors available to them, working to preserve their lives without exposing them to unnecessary risks related to treatment [8,9].

However, this has been happening day after day; every medication administered nowadays, even something as simple medication used to lower fever or any highly concentrated medication like antibiotics, anti-inflammatories, antihypertensives, lipid-lowering drugs, vitamins, chemotherapeutic agents, corticosteroids, antidepressants, anxiolytics, sleep-inducing medications, weight-control medications, all fall into the same category: they are all considered highly concentrated, and most of them are no longer compatible with the new type of human being we are today, who is actually immunocompromised due to a lack of energy in the five internal massive organs (Liver, Heart, Spleen, Lungs and Kidney) of Traditional Chinese Medicine [8,10].

In order to arrive at this diagnosis, the author had to follow her mother's advice in 1996, who told her to study Traditional Chinese Medicine, as it would be the only medicine capable of curing people in the future [8,9].

And the future arrived about 12 years ago, when the author realized in the energy measurements of her patients, they were all coming with the same pattern, which was a lack of energy in the five internal massive organs of traditional Chinese medicine, and with this change, the type of treatment proposed for these patients should be changed, since all the medicines administered by most Western doctors are highly concentrated, recommended for use after the Flexner report in 1910 [4,7,11,12].

Therefore, the intention of this article is to say that the pathophysiology involved in myocardial infarction has changed, that the medications may even be the same as those used by modern Western medicine, but should also address the lack of energy in these five internal solid organs of traditional Chinese medicine, which make up the theory of the five elements. It is of fundamental importance that their treatment be carried out by

any specialist today, especially by a cardiologist, who has not yet seen the need to study the human being in the part that he has neglected to study, which is the part of energy, invisible to the naked eye [1,3,8,10].

Blood circulation within blood vessels is part of a complex energy system, in which each organ is responsible for producing a specific amount of energy to ensure adequate force for Blood circulation, preventing Blood from stagnating within our blood vessels due to a lack of energy for these functions to function properly [8,13].

We can see that in the past, it was very difficult to find young people dying of heart attacks, but nowadays it is almost normal to see young people dying on our social media, and medicine still cannot explain the cause [14,16].

The first article the author wrote about energy changes in a patient with a history of myocardial infarction was about a patient who suffered a myocardial infarction while on vacation in the Northeast of Brazil. He experienced severe precordial pain. A diagnosis of myocardial infarction was made, and his doctor was surprised when she learned he had suffered a heart attack, as she had been taking all necessary precautions to prevent it. Despite this, he still had a heart attack. Before the heart attack, he was using cholesterol-lowering medication, antihypertensive medication, and aspirin, yet the preventative measures failed [1,3].

That is why the author is discussing in this article that the development of heart attacks today is not caused by the same pathophysiology taught in modern medical schools, but rather by energy levels, which Western medicine still does not understand and therefore does not treat accordingly [1,3,8].

The second clinical case was a middle-aged, obese man who had suffered a heart attack but presented with arterial obstruction. After the heart attack, he was prescribed cholesterol-lowering medication and aspirin, among other drugs. Two months after having a heart attack, he suffered another myocardial infarction, and during cardiac catheterization, it was seen that the obstruction he had had two months prior had increased, instead of decreasing with the use of cholesterol-lowering medication [1,2,3,8,9,10].

In the two cases mentioned above, both subjects underwent measurement of the energy of the five internal solid organs of Traditional Chinese Medicine, through a radiesthesia procedure, and what the doctor found was a total deficiency of energy in the internal organs, which are responsible for producing energy for the Blood to circulate within our body [1,3].

These organs' role like internal batteries for the operation of all the vital functioning of our body, such as sight (Liver), hearing (Kidney), smell (Lung), taste (Spleen), communication (Heart), and each organ is responsible for producing internal energy to produce *Yin* and *Yang* (Kidney), Blood (Spleen), *Qi* (Liver and Lung), and everything is controlled by the energy of the Heart [9].

Therefore, since both patients were presenting lack of energy in these fundamental organs that maintain Blood circulation, even though there was arterial obstruction in both cases, they could also have suffered a heart attack due to a lack of internal energy in these organs, causing local Blood stagnation in the energy level. Therefore, failing to understand this problem we are facing today leads doctors to continue prescribing medications that could induce a new heart attack, because all highly concentrated medications will cause an even greater drop in energy in these organs, according to the Arndt-Schultz law, created in 1888 by two German scientists, which states that the use of highly concentrated medications causes an even greater decrease in our vital energy, and the use of highly diluted medications causes an increase in our vital force, thus preventing Blood stagnation and thrombosis or myocardial infarction [1,17].

Symptoms can vary depending on the location of Blood stagnation, potentially leading to thrombosis and even pulmonary thromboembolism, as happened with a patient recently. She was using highly diluted medications to increase vital energy and prevent Blood stagnation, as the author measured her internal energy using a radiesthesia procedure, but she was experiencing emotional difficulties and facing the risk of separation from her husband. She consulted a psychiatrist who prescribed antidepressants, anxiolytics, and sleep aids. She used these medications for about six months. One day, she came to the author's clinic complaining of left chest pain that worsened with movement. She went to the hospital, where they said it was just a muscular issue and sent her home. The next day, she returned to the author's clinic and complained of chest pain. Knowing she was taking psychiatric medication, the author requested a D-dimer test immediately, but since it was Friday, she only brought the results on Monday. The test results came back very abnormal, with a D-dimer level of over 800 ng/dl (normal range is up to 500 ng/dl). The author requested immediate referral to the hospital to investigate whether it was a case of myocardial infarction. There, they performed the tests, and the electrocardiogram was normal, but they determined it was a case of pulmonary thromboembolism [8,9,18].

The patient was hospitalized in the ICU for 5 days and was discharged with medication to treat the embolism which was also highly concentrated medication. After her discharge, she returned and expressed immense gratitude for the diagnosis, which had saved her life. In this case, all patients using highly concentrated medications are at risk of developing Blood stagnation due to lack of energy in the five internal massive organs and their condition worsens with the use of these types of medications, whose complications are not fully recognized by Western medicine, which continues to use them, inducing Blood stagnation due to their concentration. According to the Arndt-Schultz law, created in 1888 by two German scientists, the use of any highly concentrated medication will further decrease vital energy, which is already compromised in the new type of human being we are currently treating. Therefore, it is recommended to use only highly diluted medications in any type of treatment nowadays to avoid complications, thrombosis, myocardial infarction, stroke, increased risks of cancer in the future, or even sudden death, as described in previous articles [8,9,18].

In another article about the development of myocardial infarction after the use of highly concentrated medications, it concerned a patient of about 50 years old who had contracted COVID-19 during the pandemic and was hospitalized for about 2 to 5 days. On the day he was discharged from the hospital, he felt chest pain when he went upstairs and returned to the hospital, where he was diagnosed with myocardial infarction. He underwent cardiac catheterization, and this examination showed that the coronary artery was perfect, without any arterial obstruction. Reviewing his medical record to ascertain what treatment he received for the COVID-19 infection, we found that he received antibiotics, anticoagulants, corticosteroids, and ivermectin, all highly concentrated. In measuring his internal energy, it was found that he was depleted of energy in the five internal solid organs of Traditional Chinese Medicine mentioned previously, and

therefore, he developed myocardial infarction after COVID-19 treatment. Not due to arterial obstruction, but due to a state of energy stagnation, caused by a drop in energy in the internal organs, caused by the use of highly concentrated medications, reducing the overall vital energy, which are usually responsible for maintaining proper Blood circulation within the blood vessels [3,19].

In another article the author wrote about myocardial infarction, it referred to a patient who had experienced myocardial infarction every two months after being kidnapped by criminals. During the first episode, she underwent cardiac catheterization, which revealed no arterial obstruction. During the second episode, she underwent cardiac catheterization again, but there was uncertainty about whether or not there was any arterial damage, although they assumed it was still normal. During the third episode, this patient also underwent catheterization, where nothing was found again. This patient came to the author's clinic to treat anxiety and panic disorder after the kidnapping incident, and during her physical examination, it was noticed that her skin was somewhat purplish. She told the author that it was due to the anticoagulant medications she was taking, after suffering from three episodes of myocardial infarction, which caused the skin to turn purplish in certain areas of her body [2].

The author measured the energy of her five internal massive organs of Traditional Chinese Medicine (Liver, Lung, Heart, Spleen, Kidneys) and what she realized was that all of the patient's internal organs were completely depleted of energy, causing her body to have an increased risk of myocardial infarction. After starting this treatment, replenishing the energy of these five internal massive organs of Traditional Chinese Medicine using highly diluted medications based on the theory the author wrote, entitled *Constitutional Homeopathy of the Five Elements Based on Traditional Chinese Medicine*, instead of treating the symptoms presented by patients, the author treated the patients nowadays directly to the root cause of most diseases, according to the principles of Chinese medicine. Thus, after starting this treatment, this patient never had another myocardial infarction [2].

Therefore, in this article, the author wants to say that we do not need to wait for a heart attack to start treatment to replenish the energy of these organs, because we can replenish their energy before diseases develop, whether emotional and or physical [5].

Furthermore, the biggest problem nowadays for people with this new global immunodeficiency is developing Blood stagnation, which is triggered when using highly concentrated medications, whether to treat pain, depression, anxiety, insomnia, diabetes, high blood pressure, cancer, etc [5,8,9,17].

Over the past 34 years since graduating, the author has developed a technique for treating her patients using only highly diluted medications, whether homeopathy, and based on the theory she wrote about treating the root of the majority of diseases using the theory she wrote titled *Constitutional Homeopathy of the Five Elements Based on Traditional Chinese Medicine*, acupuncture, and Chinese diet therapy [1,20-26].

As an infectious disease specialist, the author has developed treatment techniques for a wide variety of infectious diseases without using antibiotics, even in cases of hospital-acquired infections caused by multi-resistant bacteria [2,29].

All of this was necessary to be able to treat this new type of human being that we are treating today, who lacks energy in these organs, in order to avoid complications generated by the treatment itself, such as a myocardial infarction, which is one of the pathologies that can kill quickly [5,8,9].

Therefore, emergency measures must be taken worldwide to educate modern doctors and those graduating from medical school, so that the importance of teaching older medicines such as Traditional Chinese Medicine could be included in the medical curriculum of all schools, in addition to teaching homeopathy or the need to use highly diluted medications nowadays to avoid myocardial infarction or sudden death, as explained in this article [1,7,30,31,32].

This training should be extended to all doctors, not only cardiologists but also doctors who work in emergency units, anesthesiologists who are assessing the surgical risk of patients undergoing surgery, and all other doctors of any specialty, because we are all treating patients who are at the same energy level, that is, without internal energy [33].

The author recently saw a patient who told her that her 5-year-old niece died of a myocardial infarction after using eye drops, as she had some ocular pathology that required the use of such medication. Therefore, this situation is very serious; we do not know who might be the next to develop a myocardial infarction, as it can happen suddenly, when you least expect it [34,36].

This situation tends to worsen when the patient has any metallic implants inside the body, such as dental or orthopedic implants. If there is a need to have any implants placed inside the body, it would be better if the material were non-metallic, such as zirconium implants [37].

And the use of mobile phones with messaging capabilities can also be a source of energy loss, as they function like a cell phone, increasingly depleting your energy and causing a greater likelihood of Blood stagnation and the formation of myocardial infarction [38].

Finally, the indiscriminate use of piercings on the body also causes alterations in internal energy, leading to cardiovascular changes and a propensity for reduced energy, causing a greater tendency towards Blood stagnation [37,39].
