

## Turns of Movement

Leonard Van Zanten

Independent Researcher, Riverside Ca, USA

### ABSTRACT

Turns of movement also known as electricity describes exactly what it is, and at that magnetic movement. Forget about what current science has taught, its fundamentals in that part of the sciences are in error, come to learn the truth of things.

Keywords: Magnetic, Electric, Movement

### Essay

Science has it that; *Quote "Electricity and electrical charge, cannot be resolved into anything more fundamental than just that - to be a charge, and that electricity is just one of the physical properties of nature."* Unquote.

The reason perhaps that it has not as yet been expressed must be in the words of another quotation, that; *"Physicist are poor in expression, and Philosophers are poor in knowledge of physics"*. And to show how poor in knowledge man really is our reference will be to Figure 1.

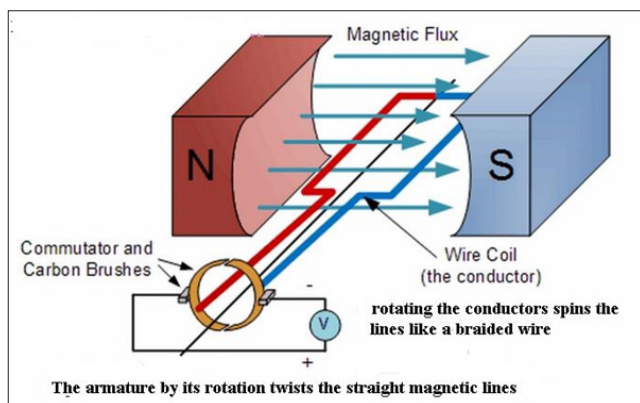

Figure 1

How is it obtained, that, which we call electricity? We first establish a magnetic field, then by way of an armature we come to rotate a suitable guide within that field, usually a copper conductor - that is to say a specific magnetic conductive substance. As then we rotate that conductor we in all reality are twisting those straight magnetic lines into a frenzy of turns upon that guide, similar in a way we twist barb-wires around each other.

What then shall be the natural result?. Without doubt or reservation, we now have a rotating line of magnetic twisted upon itself. It rotates because we are doing so. And it becomes a series of figure eights because of the twist illustrated by Figure 2.

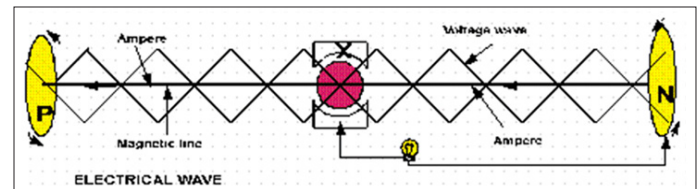

Figure 2

Here the braided magnetic line upon that conductor turns into a single direction of rotation. When therefore we view it at what is called the negative side its rotation is clockwise, while viewing it at the positive side it seems counter clockwise. This is so because of our view, our relative position; the direction of rotation being clockwise all over. And our designation for positive and negative is merely a point of view, either end can be called as we wish. Then for a more realistic view the reference will be to Figure 3, and 4.

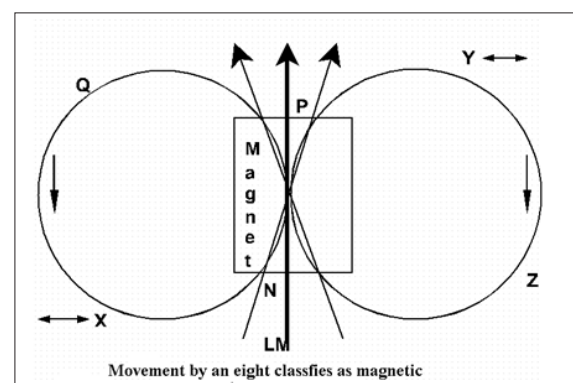

Figure 3

The two circular movements with any magnet in all truth and reality is a single circle by the design of an eight; that is why there are always two equal tides on both sides of the earth. When the moon elongates the circle between it and the earth, the other side will be equally elongated like closing the handles of a pair so scissors so will the cutting edges. One does not really believe that the moon is held gravitational, the law of Newton that we have for more than 3 centuries clearly shows how gravity is but a local force extending out from mother earth by no more than 3,200 miles.

### Cales

The data on the Hubble space telescope as given: Gross weight 24.500 lb. Orbital altitude 353 miles. Orbital velocity 17.500 mph. And to do this in whole numbers:  $24.500 \times 25.666 = 628,817.000 \times 25,666 = 16,139,217,122.000$  divided by  $22,983,840 = 702,198.46$  lb, divided by  $24.500 = 28.66$ .

This makes the Hubble telescope to have a g/force on it **28.66 times as much as it read upon the scale**, since  $702.198.46$  divided by its scale weight comes to  $28.66$ . The factor of gravity 353 miles above the earth therefore is  $28.66$  and its acceleration if it were to fall would be  $28.66 \text{ ft/sec/sec}$ .

When therefore we deduct the  $28.66$  from  $32.174$  (at sea level) it comes to a decrease of  $3.514$  in those  $353$  miles, and this divided by the  $353$  comes to  $0.009.954.674$  per mile. Then by dividing the sea level factor of  $32.174$  by the decrease per mile, comes to  $3.232$  miles, at which point the factor of gravity is zero, and the acceleration would be zero  $\text{ft/sec/sec}$ . **With our moon at a distance of some 240.000 miles, how can it possibly be held gravitational?**

Or am I the only one to use a calculator by which to obtain the results of that famous law? That which really makes it magnetic is the fact that by way of that eight the direction of movement is always incoming at what we call the South while outgoing at the North. And that my dear reader provides us with linear movement – derived from the angular movement. And since that movement as the one and only fundamental movement that God created **being conductive, and at that directionally conductive** all movements of like directions will join, with unlike directions to repel from one another. So it is that magnets move and have the power to move, to join or disjoin. All because of the movable power that God established for His creatures.

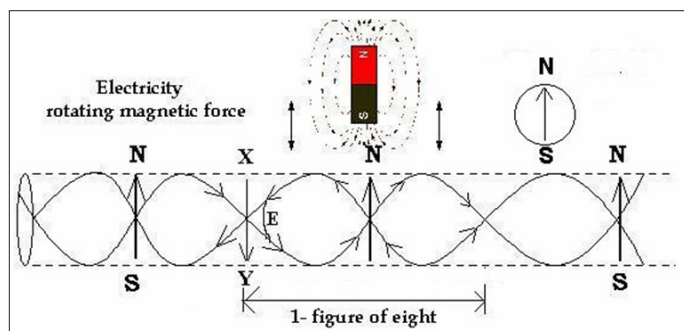

Figure 4

Then by figure 4 this is the flow of movement in what we call electricity. And the reason it is magnetic, not just because that they were magnetic to begin with, but they display that typical figure of eight as its fundamental design. The direction of movement by

eights coupled one to the other as illustrated.

If then we want proof of that - it's very simple. Electricity as a rotating magnetic field of force will have its north and south at its sides, not its ends which when faced to one another will be counter rotating agents that when connected will come to destroy one another. (short circuits).

This all in itself provides proof of the knowledge God has granted me. For when we hold any electrical conductor to any pole of a regular magnet - that wire will be push/pulled to it. And again, why may that be so? It is because that electricity is a string of magnetic movement coupled together like a braid. And by its rotation it alternately brings its north and south to that single magnetic pole.

Not positive nor negative now for these terms belong to its ends that rotate in like directions of rotation that of course comes to be counter rotations when faced to one another. **Try it out if you will**, the voltage is none other than the speed of its rotation, with ampere best termed as quell rather than movement. At 12 volt it will vibrate at 12 times a second, at 220 volt it will vibrate at 220 times each second. If that were not so I would not have said so.

To thus say that electricity is a flow of electrons –is no more than fantasy dreamed up by the ignorance among men, no atomic part will travel through any maze of substance, it be stopped at the very first atom next to it. Only movement will pass through any substance, and by movement all things are known, as well as held together.

Consider sight and sound, all by movements, and so are smell and taste as well as feeling. And no less for any magnet as well as that electricity as none other than a specific formation of movement utilizing the atoms of that copper upon which to conduct itself. It's not in parts but simply movement by coordinates. And the only reason why it is movement, is because God my Father and our Creator established movement as the prefix for His creation, His physical creation. Or as He calls it, "the Moveable Power" for it is indeed a power and unlike any other motion that we call motion.

A stone cast in the air, or a train on the move is not any conductive movement, but simply movement as a derivative, nor is the spin of an atom, or the rotation of that magnetic string upon the high voltage wires. But its internal movements that comes to appear as figures of eight, that is conductive, namely the fundamental one or power of that God called forth. And we discovered that it has a constant velocity to the tune of  $300.000\text{-km/s}$ .

Meaning also it goes through a bar of steel just as fast as it does through air or space. And do I now have you confused at saying this? Come now, I do not lie, nor do I deal with fantasies, I was not born of this earth, how then should I follow its habits? And so let us go to illustration Figure 5.

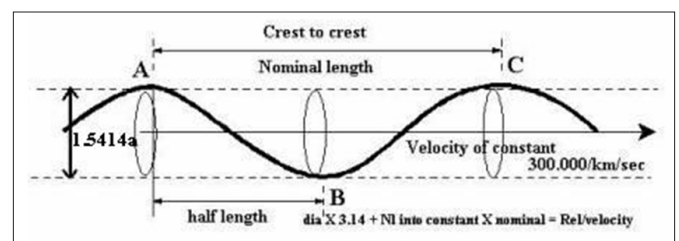

Figure 5

It is wise to understand how light or any other such movement travels through any media. For light it is sectionals imposed upon the ever constant of God's fundamental power. When for example you have a moving conveyer belt and you place boxes upon it one each second, with the belt traveling at ten meters each second your boxes are spaced by ten meters.

So it is with light, when your electricity at 120 volts (speed of rotation), imposes an angular indent upon and around the atoms of the media at the velocity of 100.000 km/s, the constant being 300.000-km/s, that is one in three the wavelength would be 3-km. And that can only occur at the rate of 120 times each second, while that conveyor belt travels at 300,000 km/s. Accordingly there can only be 120 wavelengths of light upon that so called conveyor belt 300,000 km long.

Continues wavelengths as man's scientist illustrate therefore is but a crock very wrong as is too super-impose any one wavelength upon another having a different length. That is so since each wavelength has its own relative velocity. A ten-centimeter wave cannot be imposed upon a 1-centimeter carrier wave. Simply because the ten-centimeter wave travels faster than any 1-centimeter wave.

### Example

10-cm wave =  $300.000: 10.484 \times 10 = 286,150\text{-km/s}$ . a 1-cm wave =  $300.000: 1.484 \times 1 = 202,156\text{-km/s}$ . The 10-cm wave thus travels 83,994-km/s faster than the 1-cm wave. And through the copper its velocity is also 300,000-km/s, with its relative velocity, its speed for distance in time reduced according to how often it must pass around the circumference.

How thus do we determine the speed of light or any wavelike formation for its true distance in time?. Since then, no wave is ever a wave, but an angular momentum that passes circularly like unto a coiled spring, it passes from A in the illustration over B to C. As then the crest-to-crest measure is 7000a (A to C) It's true distance is that nominal distance plus its angular in circumference. And it being 4.84a, that divided into the constant and multiplied by the nominal comes to its relative velocity. (relative meaning its distance in time) to 299,792-km/s.

In steel as in copper the true velocity is also the constant 300.000-km/s. But since it has to turn more often around the circumference in the same spacing that then slows its relative velocity. Like for blue light the nominal being 4000a  $4004.84$  into  $300,000 = 74.9\text{-etc times } 4000 = 299,637\text{-km/s}$ . That is 155-km/s slower.

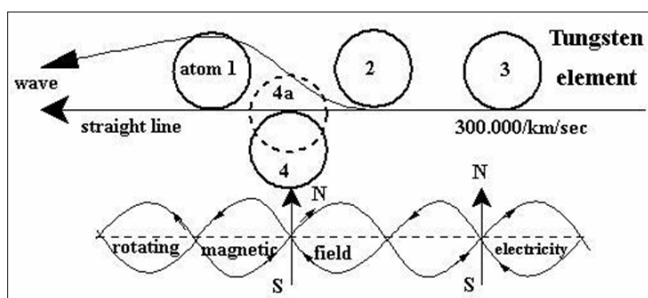

Figure 6

Then by Figure 6 let us behold how and why our common light-bulbs work to enlighten our homes. When we apply a circuit to a tungsten element the rotating current alternately brings a north and south to the atoms of that element, push pulling on them, and with the ever-fundamental movement passing everywhere at its velocity of constant, each time that the atoms of the element are driven back and forth it produces what one might call an indent into that ever-present movement. And that always in the angular or circular all atoms having angular movement. (4 to 4a into the fields of 1 and 2).

Accordingly, a wavelength as we call it is born, not anything continues, but short sections being driven linearly with the constant and angularly around all the atoms in its path. And when these coordinates (angular moments as I call them) strike our eye we as spirits interpret them for illumination, and by their specific angle into a color of illumination.

Realize therefore how absolute marvelous this is that all things become us by mere interpretation of simple movements. Without our interpretation of things, the world is dark just as it is when there are no rotating segments of motion striking our eyes. Nor is there any such thing as color in nature, we and we alone interpret color into things by slight variations in the angle of those coordinates. And we do so at what may be said the speed of light, for as billions upon billions of these coordinates come upon us, we process them at ease without ever getting tired at that volume and rate of speed. Just imagine processing billions of bits of information at any and all instances, no computer can match our spirit for speed and volume.

Absolutely phenomenal how our Creator made us to observe all things. simple spirits not only to dwell within a body made of dust, but to make it appear real for us by mere movements.

The speed now at which that electricity is able to produce these angular moments is no more than 120 times each second (120 volt). If then the impact is at the rate of 150,000 km/s. (Realizing the magnitude of it in angstroms) with the constant at 300,000-km/s, that comes to 2 to 1. If the angular impact (for the example) was 1 meter at 150,000, the constant at the same instant dragged it linearly for a distance of 2 meters. Our wavelength for the nominal would then be 2 meters. And that added to the circumference of 3.14 meters, the distance of that single moment would be 5.14 meters. The relative velocity of that so called wave would then be  $300,000: 5.14$  and that  $\times 2 = 116,731\text{-km/s}$ .

Light however is on the order of angstroms, the atoms in that tungsten element need but move fractionally, and at high velocity for its minute distance. Whereby the minute wavelengths of light may be formed. A long way from radio waves.

And now let us return to "turns of movement. With no more than a 12-volt battery in our four wheeled toys we raise that rpm to 15,000 rotations each second by no more than a coil, by passing that current through a number of physical turns, wherefore be they physical or none physical turns add for turns.

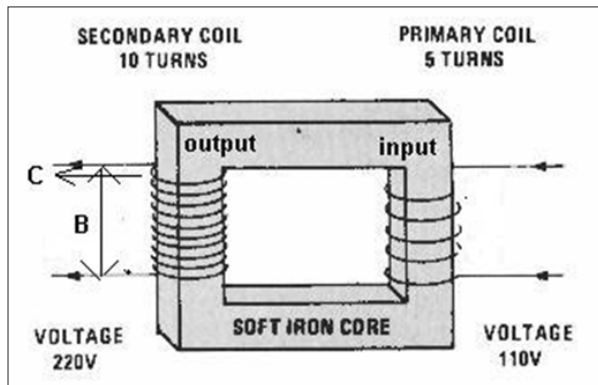

Figure 7

Here in Figure 7 (for the example) by ten turns at 110 volt we generate a whole new current at 220 volts simply by adding physical turns at the other end of our generator that erroneously are called transformers.

Or by figure 8 the current at Y needs to be a AC type so as to reverse the direction of rotation turning the bar into a pump, a magnetic pump. And so why would a new current be established at X from nothing more than magnetic pulses? It is because these turns are magnetic all the same.

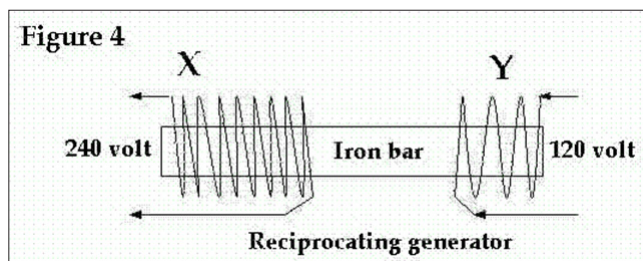

Figure 8

Here the secret to magnetic is in and by alternately reversing the direction of movement by which we set up a rotation, like as the arm on a steam locomotive to bring rotation to the wheels, remembering that magnetic is a figure eight of force always having its linear power by angular movement.

And so it is that turns add for turns be they none physical or physical. For that is exactly what electricity is to wit – “rotating magnetic entities”. Take a long straight wire upon which we apply a 120 volt and nothing will happen. Then as we face the two ends together to complete the circuit, the wire will instantly burn through. But if we place a coil of many turns in between the ends the wire will not burn through but be quelled upon like a transmission in our automobiles.

The data and secret here is when bringing both ends of the original circuit together the direction of rotation of those two are counter rotating each attempting to bring the other to its own direction of rotation. The added turns in between these two ends therefore acted as a transmission, an appeasement. Or in the case of our light-bulbs the atoms of the tungsten element served as the transmission.

Most substances like metals for their coordinate nature will accept to conduct a straight as well as any rotating magnetic field. Their

internal movement by it’s coordinate allowing it. Plastics on the other hand that have movement within them as much as any steel has, will not conduct any rotating magnetic field, their coordinate structure and formation will not allow it, as in not conduct the same.

The structural formation of the media along with its coordinate determines what it will pass, conduct, or reject, Copper conducts only a rotating magnetic field, it can not retain it like other metals, therefore suitable as a guide. Most steels will conduct both the rotating and stationary magnetic fields, and still other metals retain the fields (magnets).

Then there are substances that will conduct the flow of a rotating magnetic field but only in one specific direction of rotation, which we call diodes. The internal structural formation of that substance already has or consist of a specific rotational coordinate. When therefore by figure 9 at A it having a counter clockwise direction of rotation – the current also turning by a counter clockwise rotation will pass through it.

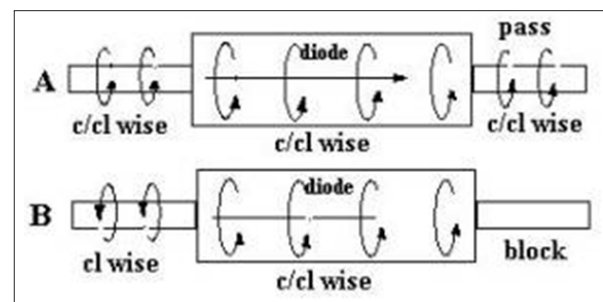

Figure 9

While at B the current being clockwise cannot be conducted, or as to say, be allowed to pass. This is one way to sort AC current into a DC current. It all comes down to direction of movement as it is with all magnets likes to adhere and un-likes to repel.

And now talking about AC verses DC power. How very ignorant Tesla as well as Thomas Edison was, neither one of them having any understanding of the devices they constructed. Tesla, according to record, wanted to generate AC power. My reply to him would be: “Hey stupid you never in your life generated DC power in the first place, it is always AC, so wake up and smell the daisies. Edison simply used commutation to convert AC into DC.

To this day electricity is always obtained in the AC format, man has yet to learn how to generate the same in the DC format. It’s not just a poor way in which we currently generate our AC power, it’s atrocious having to use so much force to drive the resulting power against the initial power. But then who is to teach man a better way, his never-ending greed always stands in the way. I know so from experience wherefore I swore to keep my secret.

Batteries now – how are they charged in fundamental terms? Well, my dear reader our title is “Turns of Movement” and that being electricity, that is also how it is stored. Remember those old clocks by wound up springs, well on so it is with turns of movement, the more turns you can cram into a battery so much the longer it will last.

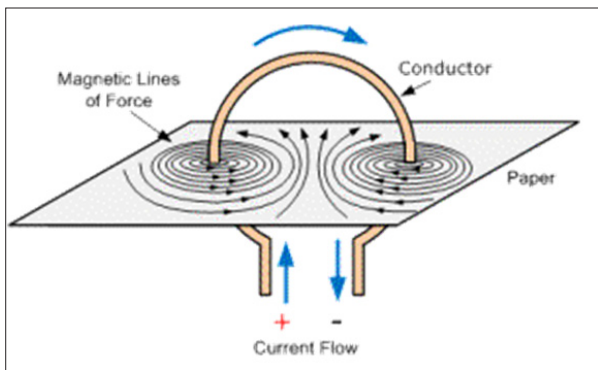

Figure 10

Figure 10 illustrates what I have been saying how that magnetic braid (electricity) has a single direction of rotation that at their ends facing each other comes to counter rotating agents. But this is a fallacy to think or claim that the magnetic field around the wire is or may be a separate thing, **for it is not**. It is merely part of the field that is within the wire, just the same as it is with any standard magnet.

If then you can correlate more than one factor at the time and add 2 plus 2 to 4, realize how all things are by movement and that such movement is not restricted to any one media, Within the standard magnet it is inside and out, and no less so for that field within and upon any wire be it stationary or rotating.

Then there is the other fallacy where it reads; “Current flow.” Since there is no such thing as – flow. Electricity as a rotating magnetic line of power is at all times stationary rotating in place. The only thing that may be said to move linearly is its coordinate that at the turn of the switch is extended outwards at near the speed of light, and for its relative velocity is calculated the same way as we do for light. The ampere as it might appear to be a flow is sight deception, the use of the current causes to quell upon it that does have its minor linear movement.

### The looks of Electricity

It goes against all man’s findings to declare that there are no waves of any kind, in the air or by any electronic device. Waves are only found at the seashore, water waves that are indeed waves as the term implies. Light and any other so-called wave of the spectrum are rotational entities driven into the linear like as along a coiled spring. (Reference figure 11) Nor are they ever continues, but sectional, for length barely one turn around the circumference.

It is by sight deception and lack of insight that we have classified them as waves. For as one can see in the illustration the movement is from top to bottom and back to top again. That by sight deception appears like a wave formation similar to sound waves. Only sound waves are directly back and forth with no side movement. We failed to realize how all magnetic waves are by a circumference, they indeed have to be that way, and can be no other way because their birth is in the angular by way of a circular impact, all magnetic entities being at angular, its format always being so.

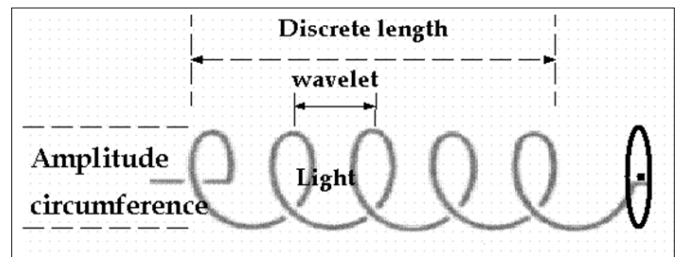

Figure 11

Then let us rehearse the magnetic nature of all atoms, as well as the impact produced by way of speed in rotation. Why do you think the power companies hang their wires so far from the pole illustrated by figure 12? It’s like anything moving in the centrifugal, the faster it spins the greater it will expand or be expanded. At 120 volt the expansion of the field is minor, but at the speed of some 200,000 rotations each second, if the wires were not far from the pole the current would arc over to the pole. Here the secret is centrifugal impact.

That expansion now is handy, it for one thing provides us with a spark at the sparkplugs, and it drives our pistons to bring rotation to the wheels of our vehicles. For yes that is the real power that drives any and all internal combustion engines, namely magnetic power.

Figures 12

What do you suppose occurs when we drive a spark into a mixture of gasoline with oxygen? It burns so we say, but yes what is burning? Our answer might be to say, a restructuring of the molecular makeup. Alright I will buy that, but how is that so?.

The spark is a high conductive movement that at the speed of light conducts its high rate of speed to the atoms all around it to raise their rate of speed (RPM) that in turn expands by centrifugal implication demanding more room. By chain reaction then the whole volume of atoms comes to demand more room that we interpret for pressure pushing down the piston.

The real power in any internal combustion engine therefore is that magnetic force of all atoms centrifugally forced demanding room to operate within. How silly therefore that puny little none existent electrons could possibly perform such a feat.

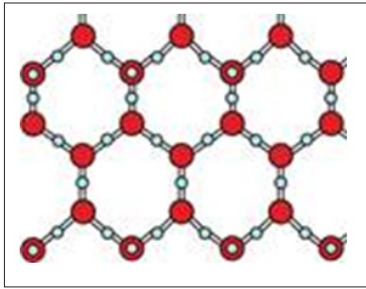

Figure 13

Then there is water as H<sub>2</sub>O, molecules that float freely along one another with a trace of magnetic binding to cause droplets etc. But with their rate (speed) of movement brought down to what we call freezing these atoms come to their full figure of eight, that is to say they become fully magnetic as may be seen by figure 13.

6 of the atoms of Oxygen come to lock unto one another by the intermediate of 6 Hydrogen atoms. And now note how all 6 of those Oxygen atoms have identical polarity facing each other. And that is what creates the openings; simple magnetic repulsion while at its other ends it attracts to and bind with the other atoms. That is the reason how and why ice demands more room than in its liquid state.

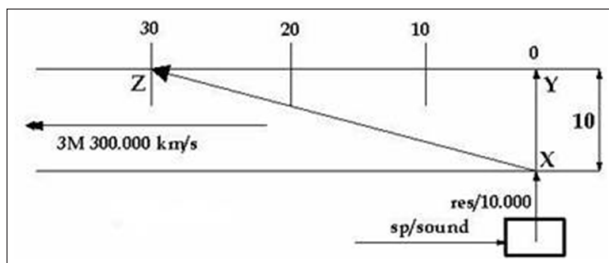

Figure 14

Then by Figure 14, I ought to rehearse how any and all wavelength are produced coming to their various lengths that again is by movement into movement and the rate of movement. When with our electronic devices we drive a series of oscillations over a certain spacing like from X to Y - 10 km at the rate of 10,000 km/s, the ever-present fundamental movement at its rate of 300,000 km/s at that same instant will drag that impulse to 30. Here thus the half-length of the wave will be 30, full length to 60-km.

### Magnetic, Magnetic

Have you ever wondered by what power you hold your feet to the ground, and/or by what power that moon is still with us? Gravity so they say. But what is gravity? What is or may be the power of gravity? Not a single person has ever discovered it, that is the foundations upon which the earth rests and has its movement around a star.

And it's a good thing no one has since by Jeremiah (31:37) the Almighty One said how He would not save any of us from the realm of death if indeed we could be that cunning. Yet then by Esdras it reads that before the return of Christ Jesus the foundations of the earth would be understood. And how can that be unless God revealed it to one of His servants? and so it is, I Know them perfectly but not of my own. Fundamentally it is magnetic, the power by which we are held to the earth. Gravity itself as such then also exists but as an inclination to downward movement, like

as a woman twirling into a man's arms and he takes her home.

That in so many words is how it works. Gravity is the female, magnetic the male. Since then, I have a number of essays already published on gravity here I wish only to impress upon us how it is by magnetic that all things are held. And for this I inserted an illustration figure 15.

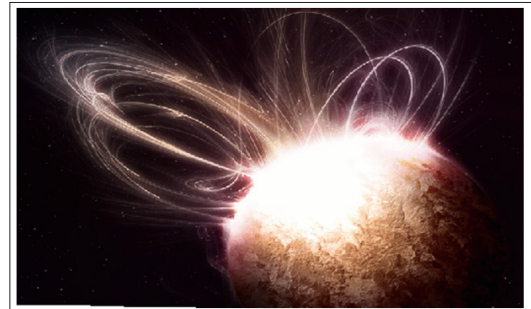

Figure 15

What may be those loops upon the sun if not the very same thing that we describe as the Van Allen belts, the magnetic circulars of its figure eight of force. For it; that magnetic movement in league with gravity holds all things to itself. Not a drop of water or a single atom can escape from it. For as each and every atom by the very movement of the earth comes to an inclination of precession, so it twirls itself into the embrace of the magnetic tentacles – that of course convinces them to be drawn inward to the center of its magnetic coordinate.

That at least is one way to explain gravity. And if these atoms – all atoms – were not duly magnetic, that is to say, have and operate by that typical figure of eight in movement, and forced into a precession by the very movements of the earth, none of them would become subject to the loving arms of earth magnetic overall coordinate. Just the same as any compass if it were not for its figure eight design it would never come to join with that of the earth.

A love scene indeed so it is for us to be drawn to the earth and remain upright directly in line with the center of the earth. Stop the earth and we would all float out into space. No not really since our orbital movement is not our only movement, there is that spin and galactic movement to also give a handle on things.

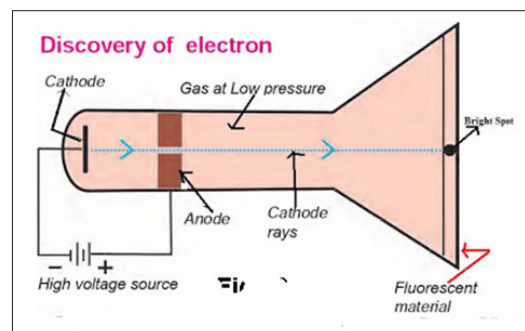

Figure 16

Figure 16, "Discovery of the electron," so it reads, but one cannot discover what does not exist. A proper heading would be to say; "Man's misconception." Or how and why electrons in the first place? What is the mentality to create electrons and/or protons

for that matter? Man took a look at his solar system with the sun at its center and planets circling about it, so that is how the atom must be, our forefathers being wet behind the ears as if the atoms are held together by eyes and hooks. And it seems how prizes like Nobel are issued for lies and foolishness. Or am I not allowed to say that?.

Figure 17 however tells a different story that is told to and believed by the very young all in order to hide the truth as they conjecture suitable for adults only. Are we as a race therefore still in our infancy? It certainly appears that way to believe upon fantasies. One man tells a lie and most of the world being ignorant not endeavoring to seek out wisdom and insight as King Solomon so dearly impressed upon us, believe upon that lie. For I call it a lie, an outright lie rather than ignorance, seeing we ought to know better and do know better.

Figure 17

The parents may have claimed the stork, but no stork was ever seen, and how did mom's belly get to be so big, and now its no longer bulging yet we have a baby sister. Does not two plus two add to four even by the young as they are taught.

But worse than all the above is  $E=mc^2$ , concocted by - to me - the most ignorant person ever to creep into the sciences, who never in his life got anything right, and due for some dreadful shame and regret, as he already is suffering in part.

Energy by all tokens is nothing other than movement, heat for the example as movement is calculated in the rate of movement, and so is work of any kind. If then we have a pebble or a bullet set in motion at high velocity shall it disintegrate to become nothing more than motion? Can that which is material become immaterial simply by moving it? Come now my dear people adapt some logic, some common sense, use your wits which the Lord has given you. Science has a law that nothing can move faster than the speed of light, and right they are in the physical universe. How then to square that figure as the man said? Is not that preposterous and in violation of their own laws. Need I say more?.

### Odds and Ends

If you hold an RPM counter to a light-bulb it will read 3600 RPM, which in fact means that your lamp is being turned off and on at that rate of frequency. The power companies used to turn their generators at 50 cycles, which is too slow for our perception it makes the light flicker. Therefore, they upgraded it to 60 cycles, a bit faster to our memory or perception so that we do not notice how that light is being turned off and on.

When you get a bill for the consumption of electricity why do you pay it? **Since you never consumed any electricity!** It in fact is impossible to consume electricity. We can utilize it but never consume it, once generated that electricity just stays there, nothing new is generated.

The electrical wire from the power company at your residence brings you the electricity with which you light your home. But that electricity, that angular formation of motion at the end of the wire is always active, and never enters your home, it merely extends itself upon the conductors in your home.

And what man calls "charge" is nothing other than motion, nothing more nor less than movement. A voltmeter to read voltage is to assess the rate of revolution (**rpm**) of the magnetic field upon the conductors, while an amp-meter registers the strength of the magnetic movement. **None of man's tools is able to detect or register an electron.**

Man has dreamed up this silly notion as if a charge could exist in singular form, as if a movement could only be going somewhere, but not coming from. And where my dear reader is the logic in that? Where is that single sided coin the scientist keeps bragging about? Show it to us, or keep your fantasies to yourselves.

Have you ever wondered why man walks upright everywhere on the earth, and his posture being directly in line with the center of the earth? Come and put on a thinking cap, if it were not the magnetic flux of the earth to embrace him, he might lie flat on the earth having no vector to which he may be drawn.

And when the moon passes over elongating that magnetic fabric between it and the earth by which the waters rise to a tide, it is not only the waters to rise, but anything not securely fastened will be moved, meaning we as well. In our upright position we come to tilt slightly when that moon passes over; And if anyone doubts my word try it out, with some sensitive equipment this will be substantiated.

And further more we will only be head to toe directly in line with the center of the earth at the equator. In California, some distance from the equator we experience also a slight tilt away from center, for at that location our vector is not only earth's center of center, but also vectored to the axis of the earth.

Take for example your weight on the scale at 180-lb, that will be so all over the earth because it is a factor of the general gravity of the earth as a whole. As then we have the habit of saying that we are being pulled with a gravitational force at 180-lb, we are not being truthful. And to prove the same with our own laws that famous one of Newton.

The date is weight 180-lb our distance at that latitude from the axis of the earth let's say 3000 miles. And that times 5280 comes to a radius of 15,840,000-ft. Our speed in rotation with mother earth is  $3000 \times 3.14$  is 9,420-miles in 24 hours. Divided by 24 comes to 392.5-m/hr,  $392.5 \times 5280 = 2,072,400$  ft/hr :60 = 34,540-ft/m: 60 = 575.6-ft/s  $180 \times 575.6 = 103,608$  X 575.6 = 59,636,765: 15,840,000 = 3.76-lb.

Our movement in rotation with the earth at that latitude places upon a person of 180-lb an additional force of gravity to the tune of 3.76-lb total gravitational pull of 183.76-lb. And why does that pull not show up on the scale? It is because our rotational movement as such inflicts upon us a centrifugal outward expanding force to the tune of 3.76-lb that is equally counteracted by the gravitational force of the earth.

Here then is the punch-line, that 3.76 g/pull is not vectored to earth's center but to the axis of the earth some distance from that

center. Our upright position therefore at that latitude is vectored to two points upon the earth, and we will have a slight tilt away from the direct center of the earth.

All this is in keeping with my heading of "Turns of Movement". For it are turns of movement by which all this comes about. Even that gravity itself comes forth by turns of movement, not only for its inward draw but for the torque placed upon all the atoms as well. It is indeed a marvelous knowledge and wisdom with insight to understand how this world was made, and how and why its foundations were set.

And not only that but how everything is held together and operate. That knowledge was given to King Solomon as well as me, only he did not write it down it being of me to do so. And now that I have done so I will have to meet the wrath of men out of jealousy with which I had to live all my days, even to destroy many years of my labors.

No doubt future generations will try out my high-sounding words, and these will find them to be accurate. What Solomon knew so well I do also, and I will have many visits and conversations with him, a Prophecy perhaps but so indeed it will be.

Perpetual motion so it is said, is impossible. That of course is a crock, each time you talk on the phone it's by perpetual motion that your voice is heard on the other end. And when you start your car, it's by perpetual motion that the engines continue to run. For that fundamental movement as I call it, or the moveable power as it is designated of the Lord, is perpetual, and moving.

All we can do is to impose upon it and utilize it for our means as we already do in many ways. Once we establish a rotational magnetic force, we can utilize it into forever, without obtaining any new, problem being we have to apply power in order to keep that force rotating. Are there then no alternate ways? Yes, there are, but who will know, or who will give away that secret? For his greed and self-esteem man should not have scorned what he had no understanding of, wherefore now the monkey is on his own back. What I will do here in this world may or will not be what I will do in the new world. Since greed will most certainly be abolished in that world, and so will the habit of caring for number one, if one gets my drift.

Perpetual motion is the most common movement in all the universe and the most abundant, and why should I speak more for a knife in my back? It will however be to our welfare but not for a while as yet. First the tally of men upon the earth has to become so few that a child can write them down. It is indeed fatal to anyone not to keep his eyes fixed on his Creator, who at all time supplies him with his needs.

## Conclusion

The nature of electricity is very simple, and yet how difficult for man to come to the knowledge thereof. It was written some 5000 years ago by a righteous person that has yet to die, who has lived for all these centuries, who said: *"Explain it to them in your wisdom, for you are their reward upon all the whole earth."*

And that is what I have been doing, and how and why I came to know so many things of which man is unaware, or has not entered his mind. Or that, which with the best of his cunning man was unable to reconcile to himself.

All this because man thought himself wiser than his Creator. Nor shall it be of me that I am so wise, or so far beyond the norm of man. But the Almighty Creator elected to shame the children of man for their wicked cunning, as He said; "To dishonor all the honored in the earth". Do not therefore conclude all this to be of me, but rather of our Creator.
