Let's Stop the Side Effects of The COVID-19 Vaccine with The New Science of Low-Level Laser Therapy

Ehsan Kamani

University of Medical Sciences, Arak, Iran

As we know, based on information and articles, irreparable complications have occurred worldwide due to the injection of the Covid vaccine. These complications include diabetes, cancer, internal diseases, heart disease, or even heart and stroke in all age groups. This is a statistical disaster world-wide. Based on my many years of study on Low-level lasers with a wavelength range of 450 to 910 nanometres, like a mother holding her child, this wavelength range with a power of 50 to 250 milliwatts can save vaccine side effects.

This Mentioned Interval Causes:

- Creating proper blood vessels
- Increasing blood cell production
- Controlling immune cells
- Reducing inflammation and infection
- Increasing the body's immunity in the right direction

Radiation inputs vary based on the patient's history and complications:

Acupuncture points, Local radiation, Intravenous radiation and Radiation through the nose and ear. This treatment method can be safely said to be effective in 80% of the complications of this fatal vaccine, and using the appropriate dose, it is the safest and most effective method available
